## Abstract

Notes taken while reading Nova [1] paper.  
Usually while reading papers I take handwritten notes, this document contains some of them re-written to *LaTeX*.  
The notes are not complete, don't include all the steps neither all the proofs.

## Contents

2.1 IVC proofs . . . . .	4

## 1 NIFS

### 1.1 R1CS modification

Want: merge 2 instances of R1CS with the same matrices into a single one.  
Each instance has  $z_i = (W_i, x_i)$  (public witness, private values resp.).

**traditional R1CS** Merged instance with  $z = z_1 + rz_2$ , for rand  $r$ . But, since R1CS is not linear  $\rightarrow$  can not apply.

eg.

$$\begin{aligned} Az \circ Bz &= A(z_1 + rz_2) \circ B(z_1 + rz_2) \\ &= Az_1 \circ Bz_1 + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1) + r^2(Az_2 \circ Bz_2) \\ &\neq Cz \end{aligned}$$

$\rightarrow$  introduce error vector  $E \in \mathbb{F}^m$ , which absorbs the cross-terms generated by folding.

→ introduce scalar  $u$ , which absorbs an extra factor of  $r$  in  $Cz_1 + r^2Cz_2$  and in  $z = (W, x, 1 + r \cdot 1)$ .

### Relaxed R1CS

$$\begin{aligned} u &= u_1 + ru_2 \\ E &= E_1 + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1 - u_1Cz_2 - u_2Cz_1) + r^2E_2 \\ Az \circ Bz &= uCz + E, \quad \text{with } z = (W, x, u) \end{aligned}$$

where R1CS set  $E = 0$ ,  $u = 1$ .

$$\begin{aligned} Az \circ Bz &= Az_1 \circ Bz_1 + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1) + r^2(Az_2 \circ Bz_2) \\ &= (u_1Cz_1 + E_1) + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1) + r^2(u_2Cz_2 + E_2) \\ &= u_1Cz_1 + \underbrace{E_1 + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1) + r^2E_2}_{E} + r^1u_2Cz_2 \\ &= u_1Cz_1 + r^2u_2Cz_2 + E \\ &= (u_1 + ru_2) \cdot C \cdot (z_1 + rz_2) + E \\ &= uCz + E \end{aligned}$$

For R1CS matrices  $(A, B, C)$ , the folded witness  $W$  is a satisfying witness for the folded instance  $(E, u, x)$ .

Problem: not non-trivial, and not zero-knowledge. Solution: use polynomial commitment with hiding, binding, succinctness and additively homomorphic properties.

**Committed Relaxed R1CS** Instance for a Committed Relaxed R1CS  $(\bar{E}, u, \bar{W}, x)$ , satisfied by a witness  $(E, r_E, W, r_W)$  such that

$$\begin{aligned} \bar{E} &= Com(E, r_E) \\ \bar{W} &= Com(E, r_W) \\ Az \circ Bz &= uCz + E, \quad \text{where } z = (W, x, u) \end{aligned}$$

## 1.2 Folding scheme for committed relaxed R1CS

V and P take two *committed relaxed R1CS* instances

$$\begin{aligned} \varphi_1 &= (\bar{E}_1, u_1, \bar{W}_1, x_1) \\ \varphi_2 &= (\bar{E}_2, u_2, \bar{W}_2, x_2) \end{aligned}$$

P additionally takes witnesses to both instances

$$\begin{aligned} (E_1, r_{E_1}, W_1, r_{W_1}) \\ (E_2, r_{E_2}, W_2, r_{W_2}) \end{aligned}$$

Let  $Z_1 = (W_1, x_1, u_1)$  and  $Z_2 = (W_2, x_2, u_2)$ .

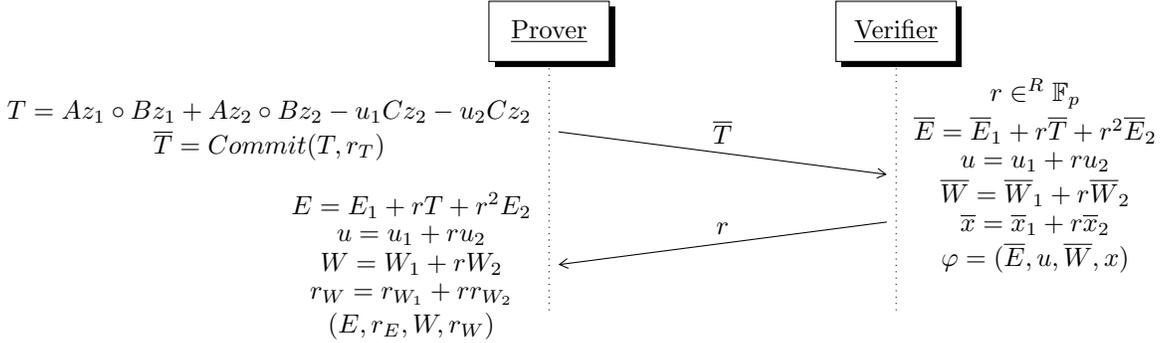

1. P send  $\bar{T} = \text{Com}(T, r_T)$ ,  
 where  $T = Az_1 \circ Bz_1 + Az_2 \circ Bz_2 - u_1Cz_2 - u_2Cz_2$   
 and rand  $r_T \in \mathbb{F}$
2. V sample random challenge  $r \in \mathbb{F}$
3. V, P output the folded instance  $\varphi = (\bar{E}, u, \bar{W}, x)$

$$\begin{aligned}\bar{E} &= \bar{E}_1 + r\bar{T} + r^2\bar{E}_2 \\ u &= u_1 + ru_2 \\ \bar{W} &= \bar{W}_1 + r\bar{W}_2 \\ x &= x_1 + rx_2\end{aligned}$$

4. P outputs the folded witness  $(E, r_E, W, r_W)$

$$\begin{aligned}E &= E_1 + rT + r^2E_2 \\ r_E &= r_{E_1} + r \cdot r_T + r^2r_{E_2} \\ W &= W_1 + rW_2 \\ r_W &= r_{W_1} + r \cdot r_{W_2}\end{aligned}$$

P will prove that knows the valid witness  $(E, r_E, W, r_W)$  for the committed relaxed R1CS without revealing its value.

The previous protocol achieves non-interactivity via Fiat-Shamir transform, obtaining a *Non-Interactive Folding Scheme for Committed Relaxed R1CS*.

Note: the paper later uses  $u_i, U_i$  for the two inputted  $\varphi_1, \varphi_2$ , and later  $u_{i+1}$  for the outputted  $\varphi$ . Also, the paper later uses  $w, W$  to refer to the witnesses of two folded instances (eg.  $w = (E, r_E, W, r_W)$ ).

### 1.3 NIFS

fold witness,  $(pk, (u_1, w_1), (u_2, w_2))$ :

1.  $T = Az_1 \circ Bz_1 + Az_2 \circ Bz_2 - u_1Cz_2 - u_2Cz_2$
2.  $\bar{T} = \text{Commit}(T, r_T)$
3. output the folded witness  $(E, r_E, W, r_W)$

$$\begin{aligned} E &= E_1 + rT + r^2E_2 \\ r_E &= r_{E_1} + r \cdot r_T + r^2r_{E_2} \\ W &= W_1 + rW_2 \\ r_W &= r_{W_1} + r \cdot r_{W_2} \end{aligned}$$

fold instances  $(\varphi_1, \varphi_2) \rightarrow \varphi, (vk, u_1, u_2, \bar{E}_1, \bar{E}_2, \bar{W}_1, \bar{W}_2, \bar{T})$ :  
 V compute folded instance  $\varphi = (\bar{E}, u, \bar{W}, x)$

$$\begin{aligned} \bar{E} &= \bar{E}_1 + r\bar{T} + r^2\bar{E}_2 \\ u &= u_1 + ru_2 \\ \bar{W} &= \bar{W}_1 + r\bar{W}_2 \\ x &= x_1 + rx_2 \end{aligned}$$

## 2 Nova

IVC (Incremental Verifiable Computation) scheme for a non-interactive folding scheme.

### 2.1 IVC proofs

Allows prover to show  $z_n = F^{(n)}(z_0)$ , for some count  $n$ , initial input  $z_0$ , and output  $z_n$ .

$F$ : program function (polynomial-time computable)

$F'$ : augmented function, invokes  $F$  and additionally performs fold-related stuff.

Two committed relaxed R1CS instances:

$U_i$ : represents the correct execution of invocations  $1, \dots, i-1$  of  $F'$

$u_i$ : represents the correct execution of invocations  $i$  of  $F'$

**Simplified version of  $F'$  for intuition**  $F'$  performs two tasks:

- i. execute a step of the incremental computation: instance  $u_i$  contains  $z_i$ , used to output  $z_{i+1} = F(z_i)$

- ii. invokes the verifier of the non-interactive folding scheme to fold the task of checking  $\mathbf{u}_i$  and  $\mathbf{U}_i$  into the task of checking a single instance  $\mathbf{U}_{i+1}$

$F'$  proves that:

1.  $\exists((i, z_0, z_i, \mathbf{u}_i, \mathbf{U}_i), \mathbf{U}_{i+1}, \bar{T})$  such that
  - i.  $\mathbf{u}_i.x = H(vk, i, z_0, z_i, \mathbf{U}_i)$
  - ii.  $h_{i+1} = H(vk, i + 1, z_0, F(z_i), \mathbf{U}_{i+1})$
  - iii.  $\mathbf{U}_{i+1} = NIFS.V(vk, \mathbf{U}_i, \mathbf{u}_i, \bar{T})$
2.  $F'$  outputs  $h_{i+1}$

$F'$  is described as follows:

$F'(vk, \mathbf{U}_i, \mathbf{u}_i, (i, z_0, z_i), w_i, \bar{T}) \rightarrow x$ :  
 if  $i = 0$ , output  $H(vk, 1, z_0, F(z_0, w_i), \mathbf{u}_\perp)$   
 otherwise

1. check  $\mathbf{u}_i.x = H(vk, i, z_0, z_i, \mathbf{U}_i)$
2. check  $(\mathbf{u}_i.\bar{E}, \mathbf{u}_i.u) = (\mathbf{u}_\perp.\bar{E}, 1)$
3. compute  $\mathbf{U}_{i+1} \leftarrow NIFS.V(vk, \mathbf{U}_i, \mathbf{u}_i, \bar{T})$
4. output  $H(vk, i + 1, z_0, F(z_i, w_i), \mathbf{U}_{i+1})$

**IVC Proof** iteration  $i + 1$ : prover runs  $F'$  and computes  $\mathbf{u}_{i+1}$ ,  $\mathbf{U}_{i+1}$ , with corresponding witnesses  $\mathbf{w}_{i+1}$ ,  $\mathbf{W}_{i+1}$ .  $(\mathbf{u}_{i+1}, \mathbf{U}_{i+1})$  attest correctness of  $i + 1$  invocations of  $F'$ , the IVC proof is  $\pi_{i+1} = ((\mathbf{U}_{i+1}, \mathbf{W}_{i+1}), (\mathbf{u}_{i+1}, \mathbf{w}_{i+1}))$ .

$P(pk, (i, z_0, z_i), \mathbf{w}_i, \pi_i) \rightarrow \pi_{i+1}$ :  
 Parse  $\pi_i = ((\mathbf{U}_i, \mathbf{W}_i), (\mathbf{u}_i, \mathbf{w}_i))$ , then

1. if  $i = 0$ :  $(\mathbf{U}_{i+1}, \mathbf{W}_{i+1}, \bar{T}) \leftarrow (\mathbf{u}_\perp, \mathbf{w}_\perp, \mathbf{u}_\perp.\bar{E})$   
 otherwise:  $(\mathbf{U}_{i+1}, \mathbf{W}_{i+1}, \bar{T}) \leftarrow NIFS.P(pk, (\mathbf{U}_i, \mathbf{W}_i), (\mathbf{u}_i, \mathbf{w}_i))$
2. compute  $(\mathbf{u}_{i+1}, \mathbf{w}_{i+1}) \leftarrow \text{trace}(F', (vk, \mathbf{U}_i, \mathbf{u}_i, (i, z_0, z_i), \mathbf{w}_i, \bar{T}))$
3. output  $\pi_{i+1} \leftarrow ((\mathbf{U}_{i+1}, \mathbf{W}_{i+1}), (\mathbf{u}_{i+1}, \mathbf{w}_{i+1}))$

$V(vk, (i, z_0, z_i), \pi_i) \rightarrow \{0, 1\}$ : if  $i = 0$ : check that  $z_i = z_0$   
 otherwise, parse  $\pi_i = ((\mathbf{U}_i, \mathbf{W}_i), (\mathbf{u}_i, \mathbf{w}_i))$ , then

1. check  $\mathbf{u}_i.x = H(vk, i, z_0, z_i, \mathbf{U}_i)$
2. check  $(\mathbf{u}_i.\bar{E}, \mathbf{u}_i.u) = (\mathbf{u}_\perp.\bar{E}, 1)$
3. check that  $\mathbf{W}_i$ ,  $\mathbf{w}_i$  are satisfying witnesses to  $\mathbf{U}_i$ ,  $\mathbf{u}_i$  respectively

**A zkSNARK of a Valid IVC Proof** prover and verifier:

$P(pk, (i, z_0, z_i), \Pi) \rightarrow \pi$ :

if  $i = 0$ , output  $\perp$ , otherwise:

parse  $\Pi$  as  $((\mathbf{U}, \mathbf{W}), (\mathbf{u}, \mathbf{w}))$

1. compute  $(\mathbf{U}', \mathbf{W}', \overline{T}) \leftarrow NIFS.P(pk_{NIFS}, (\mathbf{U}, \mathbf{W}), (\mathbf{u}, \mathbf{w}))$
2. compute  $\pi_{\mathbf{U}'} \leftarrow zkSNARK.P(pk_{zkSNARK}, \mathbf{U}', \mathbf{W}')$
3. output  $(\mathbf{U}, \mathbf{u}, \overline{T}, \pi_{\mathbf{U}'})$

$V(vk, (i, z_0, z_i), \pi) \rightarrow \{0, 1\}$ :

if  $i = 0$ : check that  $z_i = z_0$

parse  $\pi$  as  $(\mathbf{U}, \mathbf{u}, \overline{T}, \pi_{\mathbf{U}'})$

1. check  $\mathbf{u}.x = H(vk_{NIFS}, i, z_0, z_i, \mathbf{U})$
2. check  $(\mathbf{u}.\overline{E}, \mathbf{u}.u) = (\mathbf{u}_\perp.\overline{E}, 1)$
3. compute  $\mathbf{U}' \leftarrow NIFS.V(vk_{NIFS}, \mathbf{U}, \mathbf{u}, \overline{T})$
4. check  $zkSNARK.V(vk_{zkSNARK}, \mathbf{U}', \pi_{\mathbf{U}'}) = 1$
