Abstract

Notes taken while reading Nova [1] paper.

Usually while reading papers I take handwritten notes, this document contains some of them re-written to $LaTeX$.

The notes are not complete, don't include all the steps neither all the proofs.

Thanks to Levs57, Nalin Bhardwaj and Carlos Pérez for clarifications on the Nova paper.

2.1 IVC proofs 4

1 NIFS

1.1 R1CS modification

R1CS R1CS instance: (A, B, C, io, m, n), where io denotes the public input and output, $A, B, C \in \mathbb{F}^{m \times n}$, with $m \geq |io| + 1$. R1CS is satisfied by a witness $w \in \mathbb{F}^{m-|io|-1}$ such that

$$Az \circ Bz = Cz$$

where $z = (io, 1, w)$.

Want: merge 2 instances of R1CS with the same matrices into a single one. Each instance has $z_i = (W_i,\ x_i)$ (public witness, private values resp.).

traditional R1CS Merged instance with $z = z_1 + rz_2$, for rand r. But, since R1CS is not linear $\longrightarrow$ can not apply.

eg.

$$\begin{aligned} Az \circ Bz &= A(z_1 + rz_2) \circ B(z_1 + rz_2) \\ &= Az_1 \circ Bz_1 + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1) + r^2(Az_2 \circ Bz_2) \\ &\neq Cz \end{aligned}$$

$\longrightarrow$ introduce error vector $E \in \mathbb{F}^m$, which absorbs the cross-temrs generated by folding.

$\longrightarrow$ introduce scalar u, which absorbs an extra factor of r in $Cz_1 + r^2Cz_2$ and in $z = (W, x, 1 + r \cdot 1)$.

Relaxed R1CS

$$\begin{aligned} &u = u_1 + ru_2 \\ &E = E_1 + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1 - u_1Cz_2 - u_2Cz_1) + r^2E_2 \\ &Az \circ Bz = uCz + E, \quad with\ z = (W,\ x,\ u) \end{aligned}$$

where R1CS set $E = 0,\ u = 1$.

$$\begin{aligned} Az \circ Bz &= Az_1 \circ Bz_1 + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1) + r^2(Az_2 \circ Bz_2) \\ &= (u_1Cz_1 + E_1) + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1) + r^2(u_2Cz_2 + E_2) \\ &= u_1Cz_1 + \underbrace{E_1 + r(Az_1 \circ Bz_2 + Az_2 \circ Bz_1) + r^2E_2}_{\text{E}} + r^1u_2Cz_2 \\ &= u_1Cz_1 + r^2u_2Cz_2 + E \\ &= (u_1 + ru_2) \cdot C \cdot (z_1 + rz_2) + E \\ &= uCz + E \end{aligned}$$

For R1CS matrices $(A,\ B,\ C)$, the folded witness W is a satisfying witness for the folded instance $(E,\ u,\ x)$.

Problem: not non-trivial, and not zero-knowledge. Solution: use polynomial commitment with hiding, binding, succintness and additively homomorphic properties.

Committed Relaxed R1CS Instance for a Committed Relaxed R1CS $(\overline{E}, u, \overline{W}, x)$, satisfyied by a witness (E, r_E, W, r_W) such that

$$\begin{aligned} &\overline{E} = Com(E, r_E) \\ &\overline{W} = Com(E, r_W) \\ &Az \circ Bz = uCz + E, \quad where\ z = (W, x, u) \end{aligned}$$

1.2 Folding scheme for committed relaxed R1CS

V and P take two *committed relaxed R1CS* instances

$$\varphi_1 = (\overline{E}_1, u_1, \overline{W}_1, x_1)$$
$$\varphi_2 = (\overline{E}_2, u_2, \overline{W}_2, x_2)$$

P additionally takes witnesses to both instances

$$(E_1, r_{E_1}, W_1, r_{W_1})$$
$$(E_2, r_{E_2}, W_2, r_{W_2})$$

Let $Z_1 = (W_1, x_1, u_1)$ and $Z_2 = (W_2, x_2, u_2)$.

1. P send $\overline{T} = Com(T, r_T)$,
   where $T = Az_1 \circ Bz_1 + Az_2 \circ Bz_2 - u_1 Cz_2 - u_2 Cz_2$
   and rand $r_T \in \mathbb{F}$
2. V sample random challenge $r \in \mathbb{F}$
3. V, P output the folded instance $\varphi = (\overline{E}, u, \overline{W}, x)$
$$\begin{aligned} \overline{E} &= \overline{E}_1 + r\overline{T} + r^2\overline{E}_2 \\ u &= u_1 + ru_2 \\ \overline{W} &= \overline{W}_1 + r\overline{W}_2 \\ x &= x_1 + rx_2 \end{aligned}$$
4. P outputs the folded witness (E, r_E, W, r_W)
$$\begin{aligned} E &= E_1 + rT + r^2 E_2 \\ r_E &= r_{E_1} + r \cdot r_T + r^2 r_{E_2} \\ W &= W_1 + rW_2 \\ r_W &= r_{W_1} + r \cdot r_{W_2} \end{aligned}$$

P will prove that knows the valid witness (E, r_E, W, r_W) for the committed relaxed R1CS without revealing its value.

Prover | Verifier

$$T = Az_1 \circ Bz_1 + Az_2 \circ Bz_2 - u_1 Cz_2 - u_2 Cz_2$$
$$\overline{T} = Commit(T, r_T)$$

Prover $\xrightarrow{\overline{T}}$ Verifier

$$r \in^R \mathbb{F}_p$$
$$\overline{E} = \overline{E}_1 + r\overline{T} + r^2\overline{E}_2$$
$$u = u_1 + ru_2$$
$$\overline{W} = \overline{W}_1 + r\overline{W}_2$$
$$\overline{x} = \overline{x}_1 + r\overline{x}_2$$
$$\varphi = (\overline{E}, u, \overline{W}, x)$$

Verifier $\xrightarrow{r}$ Prover

$$E = E_1 + rT + r^2 E_2$$
$$u = u_1 + ru_2$$
$$W = W_1 + rW_2$$
$$r_W = r_{W_1} + rr_{W_2}$$
$$(E, r_E, W, r_W)$$

The previous protocol achieves non-interactivity via Fiat-Shamir transform, obtaining a *Non-Interactive Folding Scheme for Committed Relaxed R1CS*.

Note: the paper later uses u_i, U_i for the two inputed φ_1, φ_2, and later u_{i+1} for the outputed φ. Also, the paper later uses w, W to refer to the witnesses of two folded instances (eg. $\mathsf{w} = (E, r_E, W, r_W)$).

1.3 NIFS

fold witness, $(pk, (u_1, w_1), (u_2, w_2))$:

1. $T = Az_1 \circ Bz_1 + Az_2 \circ Bz_2 - u_1 Cz_2 - u_2 Cz_2$
2. $\overline{T} = Commit(T, r_T)$
3. output the folded witness (E, r_E, W, r_W)

$$\begin{aligned}
E &= E_1 + rT + r^2 E_2 \\
r_E &= r_{E_1} + r \cdot r_T + r^2 r_{E_2} \\
W &= W_1 + rW_2 \\
r_W &= r_{W_1} + r \cdot r_{W_2}
\end{aligned}$$

fold instances $(\varphi_1, \varphi_2) \to \varphi$, $(vk, u_1, u_2, \overline{E}_1, \overline{E}_2, \overline{W}_1, \overline{W}_2, \overline{T})$:
V compute folded instance $\varphi = (\overline{E}, u, \overline{W}, x)$

$$\begin{aligned}
\overline{E} &= \overline{E}_1 + r\overline{T} + r^2 \overline{E}_2 \\
u &= u_1 + ru_2 \\
\overline{W} &= \overline{W}_1 + r\overline{W}_2 \\
x &= x_1 + rx_2
\end{aligned}$$

2 Nova

IVC (Incremental Verifiable Computation) scheme for a non-interactive folding scheme.

2.1 IVC proofs

Allows prover to show $z_n = F^{(n)}(z_0)$, for some count n, initial input z_0, and output z_n.
F: program function (polynomial-time computable)
F': augmented function, invokes F and additionally performs fold-related stuff.

Two committed relaxed R1CS instances:
U_i: represents the correct execution of invocations $1, \ldots, i-1$ of F'
u_i: represents the correct execution of invocations i of F'

Simplified version of F' for intuition F' performs two tasks:

i. execute a step of the incremental computation: instance u_i contains z_i, used to output $z_{i+1} = F(z_i)$

ii. invokes the verifier of the non-interactive folding scheme to fold the task of checking u_i and U_i into the task of checking a single instance U_{i+1}

F' proves that:

1. $\exists((i, z_0, z_i, \mathsf{u}_i, \mathsf{U}_i), \mathsf{U}_{i+1}, \overline{T})$ such that
   i. $\mathsf{u}_i.x = H(vk, i, z_0, z_i, \mathsf{U}_i)$
   ii. $h_{i+1} = H(vk, i+1, z_0, F(z_i), \mathsf{U}_{i+1})$
   iii. $\mathsf{U}_{i+1} = NIFS.V(vk, \mathsf{U}_i, \mathsf{u}_i, \overline{T})$
2. F' outputs h_{i+1}

F' is described as follows:
$\underline{F'(vk, \mathsf{U}_i, \mathsf{u}_i, (i, z_0, z_i), w_i, \overline{T}) \rightarrow x}$:
if $i = 0$, output $H(vk, 1, z_0, F(z_0, w_i), \mathsf{u}_\perp)$
otherwise

1. check $\mathsf{u}_i.x = H(vk, i, z_0, z_i, \mathsf{U}_i)$
2. check $(\mathsf{u}_i.\overline{E}, \mathsf{u}_i.u) = (\mathsf{u}_\perp.\overline{E}, 1)$
3. compute $\mathsf{U}_{i+1} \leftarrow NIFS.V(vk, U, u, \overline{T})$
4. output $H(vk, i+1, z_0, F(z_i, w_i), \mathsf{U}_{i+1})$

IVC Proof iteration $i+1$: prover runs F' and computes u_{i+1}, U_{i+1}, with corresponding witnesses w_{i+1}, W_{i+1}. $(\mathsf{u}_{i+1}, \mathsf{U}_{i+1})$ attest correctness of $i+1$ invocations of F', the IVC proof is $\pi_{i+1} = ((\mathsf{U}_{i+1}, \mathsf{W}_{i+1}), (\mathsf{u}_{i+1}, \mathsf{w}_{i+1}))$.

$\underline{P(pk, (i, z_0, z_i), \mathsf{w}_i, \pi_i) \rightarrow \pi_{i+1}}$:
Parse $\pi_i = ((\mathsf{U}_i, \mathsf{W}_i), (\mathsf{u}_i, \mathsf{w}_i))$, then

1. if $i = 0$: $(\mathsf{U}_{i+1}, \mathsf{W}_{i+1}, \overline{T}) \leftarrow (\mathsf{u}_\perp, \mathsf{w}_\perp, \mathsf{u}_\perp.\overline{E})$
   otherwise: $(\mathsf{U}_{i+1}, \mathsf{W}_{i+1}, \overline{T}) \leftarrow NIFS.P(pk, (\mathsf{U}_i, \mathsf{W}_i), (\mathsf{u}_i, \mathsf{w}_i))$
2. compute $(\mathsf{u}_{i+1}, \mathsf{w}_{i+1}) \leftarrow trace(F', (vk, \mathsf{U}_i, \mathsf{u}_i, (i, z_0, z_i), \mathsf{w}_i, \overline{T}))$
3. output $\pi_{i+1} \leftarrow ((\mathsf{U}_{i+1}, \mathsf{W}_{i+1}), (\mathsf{u}_{i+1}, \mathsf{w}_{i+1}))$

$\underline{V(vk, (i, z_0, z_i), \pi_i) \rightarrow \{0, 1\}}$: if $i = 0$: check that $z_i = z_0$
otherwise, parse $\pi_i = ((\mathsf{U}_i, \mathsf{W}_i), (\mathsf{u}_i, \mathsf{w}_i))$, then

1. check $\mathsf{u}_i.x = H(vk, i, z_0, z_i, \mathsf{U}_i)$

2. check $(\mathsf{u}_i.\overline{E}, \mathsf{u}_i.u) = (\mathsf{u}_\perp.\overline{E}, 1)$
3. check that $\mathsf{W}_i,\ \mathsf{w}_i$ are satisfying witnesses to $\mathsf{U}_i,\ \mathsf{u}_i$ respectively

A zkSNARK of a Valid IVC Proof prover and verifier:

$P(pk, (i, z_0, z_i), \Pi) \to \pi$:
if $i = 0$, output $\perp$, otherwise:
parse Π as $((\mathsf{U}, \mathsf{W}), (\mathsf{u}, \mathsf{w}))$

1. compute $(\mathsf{U}', \mathsf{W}', \overline{T}) \leftarrow NIFS.P(pk_{NIFS}, (\mathsf{U},\ \mathsf{W}), (\mathsf{u},\ \mathsf{w}))$
2. compute $\pi_{\mathsf{u}'} \leftarrow zkSNARK.P(pk_{zkSNARK}, \mathsf{U}', \mathsf{W}')$
3. output $(\mathsf{U},\ \mathsf{u}, \overline{T}, \pi_{\mathsf{u}'})$

$V(vk, (i, z_0, z_i), \pi) \to \{0, 1\}$:
if $i = 0$: check that $z_i = z_0$
parse π as $(\mathsf{U}, \mathsf{u}, \overline{T}, \pi_{\mathsf{u}'})$

1. check $\mathsf{u}.x = H(vk_{NIFS}, i, z_0, z_i, \mathsf{U})$
2. check $(\mathsf{u}.\overline{E}, \mathsf{u}.u) = (\mathsf{u}_\perp.\overline{E}, 1)$
3. compute $\mathsf{U}' \leftarrow NIFS.V(vk_{NIFS}, \mathsf{U}, \mathsf{u}, \overline{T})$
4. check $zkSNARK.V(vk_{zkSNARK}, \mathsf{U}', \pi_{\mathsf{u}'}) = 1$
